1 Definition of a random model of publication activity

3 Continuous weight distribution

4 Discrete weight distribution

The model consists of objects (researchers), which have positive weight; it evolves in time, step by step.

It starts with a single researcher, which has random initial weight. Every step consists of the following phases.

- **(**) A new publication is born. Its authors are randomly chosen.
- 2 The new publication contributes to the weights of its authors. The bonuses are random variables.

・ロト・日本・モート モー うへぐ

A new researcher is added to the system with a random initial weight.

There are *n* researchers after n - 1 steps; each of them has positive weight.

The number of coauthors, k, is decided at random, independently of the past. The probability of selecting a given team is proportional to the total weight of the group.

The new publication contributes to the weights of the authors. The bonuses are interchangeable random variables with a joint distribution only depending on the size of the group.

A new researcher is added to the system with a random initial weight. The initial weight is independent of every other random variable in the past.

If every paper is produced by a single author, connect him and the new researcher with an edge – random recursive tree

- Albert-Barabási tree: initial weight = paper bonus = const. Bollobás-Riordan-Spencer-Tusnády (RSA, 2001) preferential attachment model with scale free property
- generalized PORT: initial weight = const., paper bonus = 1 Móri (Studia, 2002)
- uniform recursive tree: initial weight = const., no paper bonus Tapia–Myers (1967)

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

How does the weight distribution behave as the number of steps tends to infinity?

It can be studied by monitoring the proportion of researchers with weight above level t (t > 0).

(ロ)、(型)、(E)、(E)、 E) の(の)

Notations

- X_0, X_1, \ldots i.i.d. initial weights of researchers
- ν_n number of authors of the *n*th paper ($\nu_n \leq n$)
- $Y_{n,1}, Y_{n,2}, \dots, Y_{n,k}$ authors' bonuses when $\nu_n = k$; Y_n – one dimensional marginal
- $Z_n = \sum_{i=1}^{\nu_n} Y_{n,i}$ total weight of the *n*th paper
- $\xi_n(t)$ number of authors with weight > t after n-1 steps

Notations

- X_0, X_1, \ldots i.i.d. initial weights of researchers
- u_n number of authors of the *n*th paper ($u_n \leq n$)
- $Y_{n,1}, Y_{n,2}, \dots, Y_{n,k}$ authors' bonuses when $\nu_n = k$; Y_n – one dimensional marginal
- $Z_n = \sum_{i=1}^{\nu_n} Y_{n,i}$ total weight of the *n*th paper
- $\xi_n(t)$ number of authors with weight > t after n-1 steps

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Examples

- $\nu_n \stackrel{d}{=} \nu \mid \nu \leq n$,
- $\nu_n \stackrel{d}{=} \min\{\nu, n\}$
- Y_1, Y_2, \ldots i.i.d, and $Y_{n,1} = \cdots = Y_{n,\nu_n} = Y_n$
- Z_1, Z_2, \ldots i.i.d, and $Y_{n,1} = \cdots = Y_{n,\nu_n} = Z_n/\nu_n$

Conditions

- the initial weights X_n, and the pairs ((Y_{n,1},..., Y_{n,νn}), ν_n), n = 1, 2, ... are independent
- $\nu_n
 ightarrow \nu$ in distribution, and $\mathbb{E} \nu_n^2
 ightarrow \mathbb{E} \nu^2 < \infty$
- the conditional distribution of $(Y_{n,1}, \ldots, Y_{n,\nu_n})$, given $\nu_n = k$, does not depend on n

- hence Y_n and Z_n converge in distribution to some Y and Z
- X_n and Y_n are positive with positive probability
- X, Y, Z have finite moment generating functions

 ν_n : number of authors; X_n : initial weight of the *n*th author; $Y_{i,n}$: author bonus; Z_n : total weight of the *n*th paper

Continuous weight distribution

Suppose that the distributions of $Y_n | \nu_n = k (k = 1, 2, ..., n)$ and X are continuous. Introduce $F(t) = \mathbb{P}(Y > t)$, $H(t) = \mathbb{E}((\nu - 1)\mathbb{I}(Y > t))$,

$$L(t,s) = rac{sF(s) + t(1 - F(s))}{\mathbb{E}X + \mathbb{E}Z} - H(s) \quad (0 \le s \le t).$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Continuous weight distribution

Suppose that the distributions of $Y_n | \nu_n = k (k = 1, 2, ..., n)$ and X are continuous. Introduce $F(t) = \mathbb{P}(Y > t)$, $H(t) = \mathbb{E}((\nu - 1)\mathbb{I}(Y > t))$,

$$L(t,s) = rac{sF(s) + t(1 - F(s))}{\mathbb{E}X + \mathbb{E}Z} - H(s) \quad (0 \le s \le t).$$

Theorem

$$\frac{\xi_n(t)}{n} \to G(t) \text{ a.s., where } G(t) \text{ satisfies}$$

$$G(t) = \left[\int_0^t G(t-s) d_s L(t,s) + H(t) + \mathbb{P}(X > t) \right] \left[\frac{t}{(\mathbb{E}X + \mathbb{E}Z)} + \mathbb{E}\nu \right]^{-1},$$
for $t > 0$, and $G(0) = 1$.

 ν_n : number of authors; X: initial weight of the new author; Y: author bonus; Z: total weight of a paper; $\xi_n(t)$: number of authors with weight > t

A renewal-like integral equation

$$G(t) = \int_0^t G(t-s) w_{t,s} ds + r(t),$$

$$w_{t,s} = a(s) + \frac{b(s)}{t+d} + c(t,s), \quad 0 \le s \le t.$$

Here *a* is a probability density function, 0 < d, and

$$\int_0^\infty \left(a(s) + |b(s)| + \int_0^s |c(s,u)| \, du \right) z^s ds < \infty$$

for some z > 1. Under suitable conditions either G(t) = 0 for all t large enough, or $G(t) t^{\gamma} \rightarrow C$ holds as $t \rightarrow \infty$, where $0 < C < \infty$,

$$\gamma = -rac{\int\limits_{0}^{\infty} b(s)ds}{\int\limits_{0}^{\infty} sa(s)ds}\,.$$

Suppose that in the publication model all random variables concerning weigths are absolutely continuous, moment generating functions exist, and $\limsup_{t\to\infty} G(t)>0.$

Corollary

Under suitable conditions, in the absolutely continuous publication model $G(t)t^{\gamma} \rightarrow C$, where

$$\gamma = \frac{\mathbb{E}X + \mathbb{E}Z}{\mathbb{E}Y}.$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Limit distribution of the initial weights: X; author's bonus: Y; total weight of a paper: Z.

Discrete weight function

 $X \ge 0, Y \ge 0$ integer valued $\xi_n(k)$ – number of researchers with weight k

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Discrete weight function

 $X \ge 0, Y \ge 0$ integer valued $\xi_n(k)$ – number of researchers with weight k

Theorem $\frac{\xi_n(k)}{n} \to x_k \text{ a.s., where } x_k \text{ satisfies the recursion}$ $x_k = \frac{\sum_{i=1}^{k-1} x_{k-i} \left[\frac{(k-i)\mathbb{P}(Y=i)}{\mathbb{E}X + \mathbb{E}Z} + \mathbb{E}((\nu-1)\mathbb{I}(Y=i)) \right] + \mathbb{P}(X=k)}{\alpha k + \beta + 1}$ where $\alpha = \frac{\mathbb{P}(Y>0)}{\mathbb{E}X + \mathbb{E}Z}, \quad \beta = \mathbb{E}((\nu-1)\mathbb{I}(Y>0)).$

 ν : number of authors; X: initial weight of the new author;

Y: author bonus; Z: total weight of a paper

A renewal-type recursion

This is a renewal-type equation of the form

$$x_k = \sum_{i=1}^{k-1} x_{k-i} w_{k,i} + r_k,$$

where $\lim_{k\to\infty} w_{k,i} = a_i$, and $(a_1, a_2, ...)$ is a probability distribution. [c.f. *Cooper–Frieze* (RSA, 2003), *Milne-Thompson* (1933)] If $w_{k,i} = a_i$, then $x_k \to C$. Does that o(1) make any difference?

A renewal-type recursion

This is a renewal-type equation of the form

$$x_k = \sum_{i=1}^{k-1} x_{k-i} w_{k,i} + r_k,$$

where $\lim_{k\to\infty} w_{k,i} = a_i$, and $(a_1, a_2, ...)$ is a probability distribution. [c.f. Cooper-Frieze (RSA, 2003), Milne-Thompson (1933)]

If $w_{k,i} = a_i$, then $x_k \to C$. Does that o(1) make any difference?

Example

Let (a_i) be arbitrary, $x_k = 2 + \sin(\log(k+1))$, and

$$w_{k,i} = a_i + \left(x_k - \sum_{i=1}^{k-1} x_{k-i}a_i\right) \left(\sum_{i=1}^{k-1} x_i\right)^{-1}$$

Then $w_{k,i} = a_i + o(1)$, and $x_k = \sum_{i=1}^{k-1} x_{k-i} w_{k,i} + 2\delta_{k,1}$.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Consider the recursion

$$x_k = \sum_{i=1}^{k-1} x_{k-i} w_{k,i} + r_k, \quad w_{k,i} = a_i + \frac{b_i}{k} + c_{k,i}, \quad 1 \le i \le k.$$

Suppose that $a_k \ge 0$ and the greatest common divisor of the positive terms is 1; $r_k \ge 0$ and not all of them is 0; there exists z > 0 such that

$$1 < \sum_{k=1}^{\infty} a_k z^k < \infty, \qquad \qquad \sum_{k=1}^{\infty} |b_k| z^k < \infty,$$
$$\sum_{k=1}^{\infty} \sum_{i=1}^{k-1} |c_{k,i}| z^i < \infty, \qquad \qquad \sum_{k=1}^{\infty} r_k z^k < \infty.$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Theorem

Under these conditions the following holds. Either $x_k = 0$ if k is large enough, or $x_k k^{\gamma} q^k \rightarrow C$ as $k \rightarrow \infty$, where $0 < C < \infty$, q is the positive solution of the equation $\sum_{k=1}^{\infty} a_k q^k = 1$, and

$$\gamma = -\left(\sum_{k=1}^{\infty} b_k q^k\right) \left(\sum_{k=1}^{\infty} k a_k q^k\right)^{-1}$$

In the most important particular case (a_k) is a probability distribution, $a_k, b_k, c_{k,i}$ and r_k vanish exponentially fast, hence q = 1, and x_k decays at a polynomial rate.

Corollary

In the discrete publication model $x_k k^{\gamma} \to C$, where $\gamma = \frac{\mathbb{E}X + \mathbb{E}Z}{\mathbb{E}Y} + 1$.

Method of the stochastic part

Discrete parameter martingales are used to prove the following

Main lemma

 $\begin{aligned} & (\mathcal{F}_n) \text{ filtration, } (\xi_n) \text{ nonnegative adapted, } \mathbb{E}((\xi_n - \xi_{n-1})^2 \mid \mathcal{F}_{n-1}) \\ &= O\left(n^{1-\delta}\right), \ \delta > 0, \ (u_n), \ (v_n) \text{ nonnegative predictable, } u_n < n. \\ & (1) \text{ Suppose } \mathbb{E}(\xi_n \mid \mathcal{F}_{n-1}) \leq \left(1 - \frac{u_n}{n}\right)\xi_{n-1} + v_n, \\ & \text{where } u_n \to u, \ \text{lim sup } v_n \leq v, \ \text{and } u, v > 0. \ \text{Then} \end{aligned}$

$$\limsup_{n\to\infty}\frac{\xi_n}{n}\leq\frac{v}{u+1}\quad a.s.$$

(2) Suppose $\mathbb{E}(\xi_n | \mathcal{F}_{n-1}) \ge \left(1 - \frac{u_n}{n}\right)\xi_{n-1} + v_n$, where $u_n \to u$, $\liminf v_n \ge v$, and u, v > 0. Then

$$\liminf_{n\to\infty}\frac{\xi_n}{n}\geq\frac{v}{u+1}\quad a.s.$$

This is a stochastic counterpart of a lemma of *Chung and Lu* (2006).

Proposition

Let (M_n, \mathcal{G}_n) be a square integrable nonnegative submartingale, and

$$A_{n} = EM_{1} + \sum_{i=2}^{n} (E(M_{i}|G_{i-1}) - M_{i-1}),$$
$$B_{n} = \sum_{i=2}^{n} \operatorname{Var}(M_{i}|G_{i-1}).$$

If $B_n^{1/2} \log B_n = O(A_n)$, then $M_n/A_n \to 1$ holds almost everywhere on the event $\{A_n \to \infty\}$.

This is a consequence of Neveu [3], Propositions VII-2-3 and VII-2-4.
